

Update1:

We have implemented a module for our project which gives us a parameter for measuring the score of assignments.

The measured parameter is Average Running time of Solutions(Java assignments).Running time is found for all the test cases and the average of them is taken only for the Correct Solutions.

Correct solutions are those when given an Input file the output of the programs matches with the expected output file and also we were able to plot a graph for the test programs on basis of running time.Our module not only works for a single file but also runs when given Input with the Solutions and test cases path files.It gives output for all the given input files.
